Customer Journey Map

Car Rental Request Automation in ServiceNow

Date: 7 October 2026

Scenario: a business car rental request is raised, approved, fulfilled and closed through the Service Catalog

Stage	1. Entice	2. Enter	3. Engage	4. Exit	5. Extend	Overall
Key question	How does an employee first learn that a car rental request process exists?	What does the employee go through when beginning a request?	Core moments: approval, task assignment and fulfillment	How does the request wrap up?	What happens once the rental is over?	The end-to-end experience
Steps	Finds the catalog item through the Service Portal, intranet or a manager's tip	Opens the "Car Rental Request" item, enters dates, locations, duration, car type and reason, then clicks Order Now	Manager gets the approval and approves or rejects it → Transport team receives an SCTASK → car is assigned and the task fulfilled	Task is closed → request is closed → requester is told the rental is complete	Past requests stay in My Requests; the employee can leave feedback or raise a new request	A fully automated lifecycle from request to closed rental
Interactions	Service Portal and catalog search; knowledge articles	Catalog form variables; order confirmation with REQ / RITM number	Approval by email or portal; SCTASK work notes; Transport group queue	Closure email; status change on the RITM	My Requests list; optional survey or feedback form	Catalog + Flow Designer + Notifications + Portal
Goals & motivations	"Let me book a car for my business trip quickly."	"Let me give complete details without any trouble."	"Get my approval done fast and the car assigned on time."	"Let me know the rental is confirmed and ready."	"Make it easy to ask again or look back at my history."	Cut manual coordination and make tracking transparent
Positive moments	Catalog item has a clear name and description and is easy to find	Simple form; request number appears instantly; confirmation email arrives	Automatic routing; clear approval screen; task shows up right after approval	Closure notification arrives on time with a summary	Full history is visible; re-requesting takes one click	End-to-end automation, audit trail and SLA visibility
Pain points	Employee does not know the process exists or picks the wrong catalog item	Mandatory fields missed; car type options unclear; form feels long	Manager is slow to respond; rejection reason unclear; Transport has a backlog	Actual car details are not confirmed to the requester	Old requests are hard to find and earlier data cannot be reused	Manual chasing is needed whenever a notification fails
Opportunities	Advertise the item on the intranet; add a knowledge article with screenshots	Add help text and tooltips, dynamic variables and pre-filled profile data	SLA reminders, auto-escalation of approvals and a car availability check in the flow	Put the assigned car's details into the closure notification	Add a "Request again" button and a short survey after closure	Dashboards for Transport and managers; improve continuously using metrics

Key stakeholders: Employee (requester), Manager (approver), Transport / Fleet team, ServiceNow administrator.

Main channels: ServiceNow Service Catalog, Service Portal, email notifications, back-end forms (RITM, SCTASK, Approval).

Automation backbone: Flow Designer (triggered by the catalog request) with Business Rules, Notifications and Update Set deployment.
