Project Design Phase-II

Solution Requirements (Functional & Non-functional)

Date	Team ID	Project Name	Maximum Marks
7 October 2026		Car Rental Request Automation in ServiceNow	4 Marks

Functional Requirements

The functional requirements below describe the proposed Car Rental Request Automation solution, built on the ServiceNow Service Catalog and Flow Designer.

FR No.	Functional requirement (epic)	Sub-requirements (story / sub-task)
FR-1	Car rental request submission	Build the Service Catalog item “Car Rental Request” Form variables: requested date, pick-up location, drop-off location, duration, car type, reason / justification Order Now / Submit generates the REQ and RITM
FR-2	Approval workflow	Primary approval by the requester’s manager Conditional second approval for long durations or premium cars Approval or rejection recorded together with comments
FR-3	Task assignment & fulfillment	Automatic SCTASK for the Transport / Fleet team after approval Assignment group routing and work-note updates Car assignment and availability check Closing the task moves the request to Closed Complete
FR-4	Notifications & communication	Notice when a request is submitted Alert to the manager for a pending approval Message to the requester on approval or rejection Alert to the Transport team about a new task Closure notice with a summary
FR-5	Status tracking & visibility	Live status on the RITM / REQ Service Portal and My Requests view for end users Activity stream and work notes as an audit trail
FR-6	SLA & reporting	SLAs for the approval and fulfillment stages Dashboards and reports on open requests, cycle time and SLA breaches Configuration kept in Update Sets for easy transport

Non-functional Requirements

The non-functional requirements below describe the quality expected from the solution.

NFR No.	Requirement	Description
NFR-1	Usability	Clear, easy-to-follow catalog form with labels, help text and mandatory markers Few clicks needed to submit and track a request through the Service Portal / My Requests Look and feel consistent with the existing ServiceNow instance branding

NFR No.	Requirement	Description
NFR-2	Security	Role-based access: only signed-in employees can request and managers approve only their own reports ACLs on the catalog item, RITM, SCTASK and any custom inventory table Audit logging of all approvals, task updates and state changes Personal data handled according to organizational policy
NFR-3	Reliability	Flow Designer error handling and retry when a notification fails Business Rules and flow conditions stop a request moving on without the required approvals Mandatory variables checked for integrity before a task is created
NFR-4	Performance	Catalog form loads in under 3 seconds under normal load Approval routing and task creation complete within seconds Efficient GlideRecord queries; no heavy client scripts on form load
NFR-5	Availability	Available whenever the ServiceNow instance is available (platform SLA) Custom configuration adds no single point of failure; Update Sets can be deployed across instances
NFR-6	Scalability	Handles many concurrent requests through the platform architecture Flow Designer and Business Rules scale with instance capacity New car types, locations or multi-level approvals can be added without redesign

Note: all configuration (catalog item, variables, flow, Business Rules, notifications) will be captured in an Update Set so it can be promoted in a controlled way from development to test and production.
